**Note:**

- During the attendance check a sticker containing a unique code will be put on this exam.
- This code contains a unique number that associates this exam with your registration number.
- This number is printed both next to the code and to the signature field in the attendance check list.

## Algorithms for Scientific Computing

**Exam:** IN2001 / Tech Test

**Date:** Monday 19<sup>th</sup> July, 2021

**Examiner:** Michael Bader

**Time:** 08:00 – 18:00

### Working instructions

- This exam consists of **10 pages** with a total of **4 problems**.  
Please make sure now that you received a complete copy of the exam.
- The total amount of achievable credits in this exam is 44 credits.
- Detaching pages from the exam is prohibited.
- Allowed resources:
  - one **non-programmable pocket calculator**
  - one **analog dictionary** English ↔ native language
- Subproblems marked by \* can be solved without results of previous subproblems.
- **Answers are only accepted if the solution approach is documented.** Give a reason for each answer unless explicitly stated otherwise in the respective subproblem.
- Do not write with red or green colors nor use pencils.
- Physically turn off all electronic devices, put them into your bag and close the bag.

## Problem 1 Quarter-Wave Discrete Sine Transform (11 credits)

Given is a real-valued input data-set  $f_0, \dots, f_{2N-1} \in \mathbb{R}$  (i.e., length  $2N$ ) with the symmetry conditions  $f_{2N-n-1} = -f_n$ . Complete the tasks below.

0	<input type="checkbox"/>
1	<input type="checkbox"/>
2	<input type="checkbox"/>
3	<input type="checkbox"/>
4	<input type="checkbox"/>
5	<input type="checkbox"/>

a) Show that the corresponding Quarter-Wave Fourier coefficients

$$F_k = \frac{1}{2N} \sum_{n=0}^{2N-1} f_n \omega_{2N}^{-k(n+\frac{1}{2})} \quad (1.1)$$

have only imaginary values and can be written as

$$F_k = -\frac{i}{N} \sum_{n=0}^{N-1} f_n \sin\left(\frac{\pi k}{N} \left(n + \frac{1}{2}\right)\right) \quad (1.2)$$

b) Show that the coefficients  $F_k$  of the QW-DST again justify a symmetry condition!

c) Let `real-FFT(g,N)` be a procedure that computes the Fourier coefficients  $G_k$  efficiently from a real data-set  $g$  that consists of  $2N$  values  $g_n$ . Describe a **procedure** `QW-DST(g,N)` that uses the given procedure `real-FFT` to compute the coefficients  $F_k$  for  $k = 0, \dots, N - 1$  from equation (1.2) for the (non-symmetrical) real data  $f_0, \dots, f_{N-1}$ , stored in the parameter field  $g$ . Note: `real-FFT(g,N)` **does not** compute a QW-RDFT!

## Problem 2 Wavelets Approximation (12 credits)

The cubic Battle-Lemarié wavelet is given by the coefficients  $\{c_k\}$ :

$$c_0 = \frac{1}{8} \quad c_1 = \frac{1}{2} \quad c_2 = \frac{3}{4} \quad c_3 = \frac{1}{2} \quad c_4 = \frac{1}{8}. \quad (2.1)$$

Starting with the mother hat function

$$\phi_0(t) = \max\{1 - |t|, 0\}, \quad (2.2)$$

we can compute an approximation of the scaling and wavelet functions by iterating over their dilation equations. Ignoring the scaling factor such as  $\frac{1}{\sqrt{2}}$ , the dilation equation for the scaling (father) function is given by

$$\phi_{n+1}(t) = \sum_{k=0}^4 c_k \cdot \phi_n(2t - k), \quad (2.3)$$

and the dilation equation for the wavelet (mother) function is given by

$$\psi_{n+1}(t) = \sum_{k=0}^4 (-1)^k c_{K-k} \cdot \phi_n(2t - k), \quad \text{where } K = 4. \quad (2.4)$$

a) In the given figure below, sketch the first approximation of the scaling function  $\phi_1(t)$  and the wavelet function  $\psi_1(t)$  on the interval  $[-1, 3]$ .

**Hint 1:** Use the given helper table on the right to compute the values of  $\phi_1(t)$  and  $\psi_1(t)$  at given points to help for your sketching.

**Hint 2:** Backup figure and helper table is provided in case you need to correct your solutions.

	$\phi_1(t)$	$\psi_1(t)$
$t = -1.0$		
$t = -0.5$		
$t = 0.0$		
$t = 0.5$		
$t = 1.0$		
$t = 1.5$		
$t = 2.0$		
$t = 2.5$		
$t = 3.0$		

b) By observation, what conclusion can you draw for the integral of the obtained wavelet, i.e.,  $\int_{-\infty}^{+\infty} \psi_1(t)$ ? Explain, what this implies for wavelets in general.

### Problem 3 Sparse Grids (10 credits)

0	<input type="checkbox"/>
1	<input type="checkbox"/>
2	<input type="checkbox"/>
3	<input type="checkbox"/>
4	<input type="checkbox"/>
5	<input type="checkbox"/>
6	<input type="checkbox"/>

a) Name **two** different data structures for sparse grids. For each of them, discuss the following points:

- (i) Hierarchization/dehierarchization (Hint: consider data access and traversal complexity)
- (ii) Spatial adaptivity
- (iii) Memory consumption

b) Discuss whether the following two grids are valid sparse grids. Explain your reasons. You can annotate the grids directly.

### Problem 4 Space-filling Curves - Peano-Meander Curve (11 credits)

Figure 4.1 depicts the first two iterations of a Meander type Peano curve.

Figure 4.1: First two iterations of a Peano-Meander curve.

a) Find a grammar which constructs the Peano-Meander curve from figure 4.1.

A vertical stack of six empty square boxes, indexed 0 to 5 from top to bottom.

This image shows a full page of blank graph paper. The grid consists of small, equal-sized squares formed by thin gray lines. There are 20 columns and 20 rows of squares, creating a total of 400 square units. The grid covers the entire area of the page, leaving no margins or other markings.

b) Given is a parametrization  $q(t)$  of the Peano-Meander curve

$$q(0_9.n_1n_2n_3n_4\dots) = Q_{n_1} \circ Q_{n_2} \circ Q_{n_3} \circ Q_{n_4} \circ \dots \begin{pmatrix} 0 \\ 0 \end{pmatrix}, \quad (4.1)$$

where  $t = 0_9.n_1n_2n_3n_4\dots$  is the representation of  $t$  in a base nine system.

1) Determine the operators  $Q_1$ ,  $Q_4$  and  $Q_6$ .

2) Compute the coordinates of  $q(\frac{2}{3})$  and  $q(\frac{1}{2})$ .

**Additional space for solutions—clearly mark the (sub)problem your answers are related to and strike out invalid solutions.**
